

The List Polynomial

Samuel Desrochers

Work done under the supervision of
Simon Henry and Phil Scott

Thinking about lists...

$L(X)$: finite lists on a set X

Consider: the set of lists on X of length 3.
This is just $X \times X \times X$.

The set of lists of length 3 on $X = \mathbb{Z}$

$\left\{ \begin{array}{l} [1, 5, -1], \\ [3, -2, 9], \\ [0, 0, 12], \\ [-4, -1, 1], \\ \dots \end{array} \right\}$

Thinking about lists...

$L(X)$: finite lists on a set X

Consider: the set of lists on X of length 3.
This is just $X \times X \times X$.

$$\text{Therefore: } L(X) = \sum_{n \in \mathbb{N}} X^n$$

The set of lists of length 3 on $X = \mathbb{Z}$

$$\left\{ \begin{array}{l} [1, 5, -1], \\ [3, -2, 9], \\ [0, 0, 12], \\ [-4, -1, 1], \\ \dots \end{array} \right\}$$

It's a polynomial!

$X \mapsto L(X)$ is a functor $\mathbf{Set} \rightarrow \mathbf{Set}$

It has a particular shape: $L(X) = \sum_{n \in \mathbb{N}} X^n$

It is a *polynomial functor*.

Let's generalize!

Usual polynomials:

$$\begin{aligned} & 1 + x^2 + x^7 \\ & = \\ & \sum_{i \in I} x^{a_i} \\ & \text{for } I = \{1, 2, 3\}, \\ & a_1 = 0, a_2 = 2, a_3 = 7. \end{aligned}$$

$L(X)$: lists on a set X

List objects in general

In a category with finite products:

- List object $L(X)$
- Empty list $1 \rightarrow L(X)$
- Append operation $X \times L(X) \rightarrow L(X)$

Inductively define $f : A \times L(X) \rightarrow B$

- $f(a, \emptyset) = g(a)$
- $f(a, x :: \ell) = h(a, x, \ell, f(a))$

$$\begin{array}{ccc}
 & & A \times L(X) \\
 \langle \text{Id}_A, (r_0^X)_A \rangle \nearrow & & \downarrow f \\
 A & & B \\
 \searrow g & & \\
 & &
 \end{array}$$

$$\begin{array}{ccc}
 A \times X \times L(X) & \xrightarrow{\text{Id}_A \times r_1^X} & A \times L(X) \\
 \downarrow \langle \text{Id}, f \rangle & & \downarrow f \\
 A \times X \times L(X) \times B & \xrightarrow{h} & B
 \end{array}$$

List objects in general

If a category \mathcal{C} has finite products, and for each object X there is a list object $L(X)$, then we can form a functor:

$$L : \mathcal{C} \rightarrow \mathcal{C} : X \mapsto L(X)$$

Is this a polynomial functor?

What is a polynomial functor?

Internal language of slice categories

In a slice category \mathcal{C}/A , an object $f : B \rightarrow A$ is thought of as a collection of sets indexed by A :

$$(B_a \mid a \in A)$$

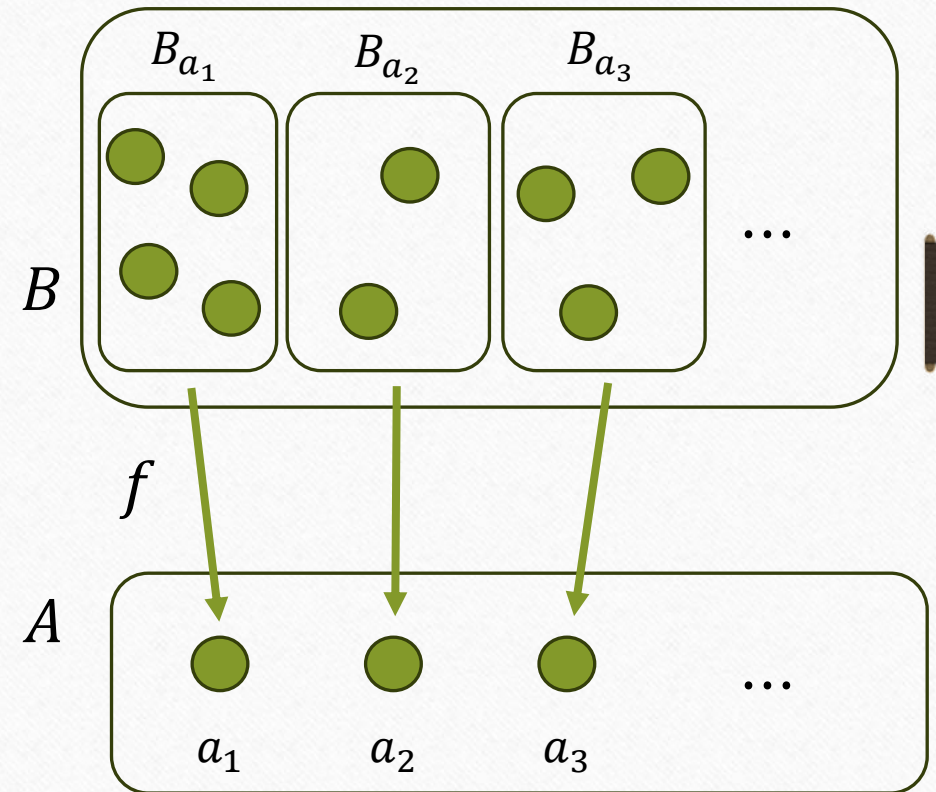

“ $B_a = f^{-1}(a)$ ” for “ $a \in A$ ”

Adding syntax

If $f : B \rightarrow A$ is denoted $(B_a \mid a \in A)$,
how should we interpret the following
notation?

$$\sum_{a \in A} B_a$$

In the slice category \mathcal{C}/A

Adding syntax

If $f : B \rightarrow A$ is denoted $(B_a \mid a \in A)$,
how should we interpret the following
notation?

$$\sum_{a \in A} B_a = B$$

There is a functor $\Sigma_A : \mathcal{C}/A \rightarrow \mathcal{C}$ given by
 $(f : B \rightarrow A) \mapsto B$

Or: $(B_a \mid a \in A) \mapsto \Sigma_{a \in A} B_a$.

In the slice category \mathcal{C}/A

Adding syntax

How should we interpret the following notations? What is the corresponding $f : B \rightarrow A$?

- $(1 \mid a \in A)$
- $(X \mid a \in A)$
- $(C_a \times D_a \mid a \in A)$

In the slice category \mathcal{C}/A

Adding syntax

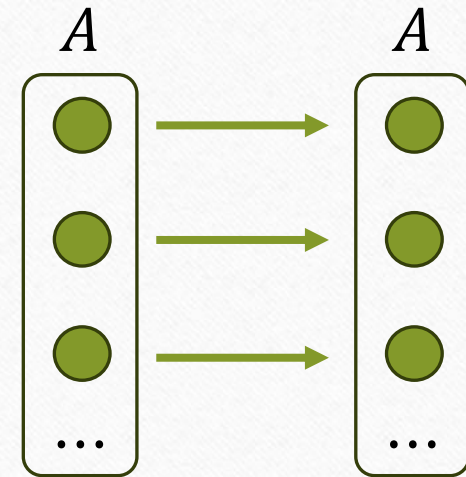

How should we interpret the following notations? What is the corresponding $f : B \rightarrow A$?

- $(1 \mid a \in A)$

- $Id : A \rightarrow A$

- $(X \mid a \in A)$

- $(C_a \times D_a \mid a \in A)$

In the slice category \mathcal{C}/A

Adding syntax

How should we interpret the following notations? What is the corresponding $f : B \rightarrow A$?

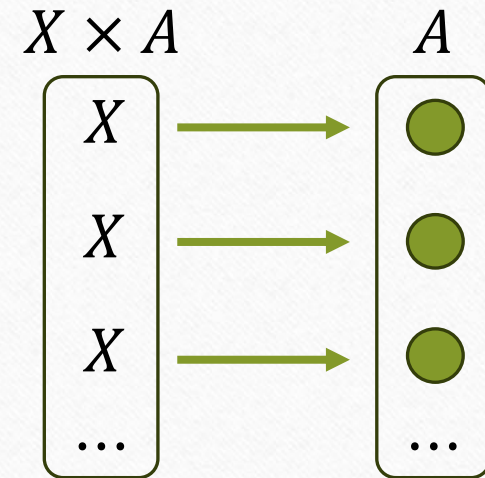

- $(1 \mid a \in A)$

- $(X \mid a \in A)$

- $(C_a \times D_a \mid a \in A)$

- $Id : A \rightarrow A$

- $\pi_2 : X \times A \rightarrow A$

In the slice category \mathcal{C}/A

Adding syntax

How should we interpret the following notations? What is the corresponding $f : B \rightarrow A$?

- $(1 \mid a \in A)$

- $Id : A \rightarrow A$

- $(X \mid a \in A)$

- $\pi_2 : X \times A \rightarrow A$

- $(C_a \times D_a \mid a \in A)$

- $C \times_A D \rightarrow A$

In the slice category \mathcal{C}/A

Slices of categories with finite limits

If \mathcal{C} has finite limits, then so does \mathcal{C}/A .

There is a functor $\Delta_A : \mathcal{C} \rightarrow \mathcal{C}/A$ given by $X \mapsto (\pi_2 : X \times A \rightarrow A)$.

Or: $X \mapsto (X \mid a \in A)$.

Adding syntax

If $g : C \rightarrow A$ and $f : B \rightarrow A$ are represented by $(C_a \mid a \in A)$ and $(B_a \mid a \in A)$, respectively, how should we interpret the following notation?

$$((C_a)^{B_a} \mid a \in A)$$

In the slice \mathcal{C}/A of a category \mathcal{C} with finite limits

Adding syntax

If $g : C \rightarrow A$ and $f : B \rightarrow A$ are represented by $(C_a \mid a \in A)$ and $(B_a \mid a \in A)$, respectively, how should we interpret the following notation?

$$((C_a)^{B_a} \mid a \in A)$$

The exponential of g and f in \mathcal{C}/A (if it exists!)

Recall: f is **exponentiable** (in \mathcal{C}/A) if the exponential g^f exists for any g . In this case, we have a functor $(-)^f : \mathcal{C}/A \rightarrow \mathcal{C}/A$.

In the slice \mathcal{C}/A of a category \mathcal{C} with finite limits

Polynomial functors, finally!

Let $f : B \rightarrow A$ be an arrow in a category \mathcal{C} with finite limits. Assume f is exponentiable in \mathcal{C}/A .

Write f in the internal language of \mathcal{C}/A as $(B_a \mid a \in A)$. The **polynomial functor** P_f associated to f is:

$$\begin{array}{ccccccc} \mathcal{C} & \xrightarrow{\Delta_A} & \mathcal{C}/A & \xrightarrow{(-)^f} & \mathcal{C}/A & \xrightarrow{\Sigma_A} & \mathcal{C} \\ X & \longmapsto & (X \mid a \in A) & \longmapsto & (X^{B_a} \mid a \in A) & \longmapsto & \sum_{a \in A} X^{B_a} \end{array}$$

The list polynomial?

A functor $P : \mathcal{C} \rightarrow \mathcal{C}$ is **polynomial** if $P \cong P_f$ for some $f : B \rightarrow A$ (which must be exponentiable in \mathcal{C}/A).

So... is $L : X \rightarrow L(X)$ polynomial?

P_f : the polynomial functor associated to f

$L(X)$: list object on an object X

The list polynomial?

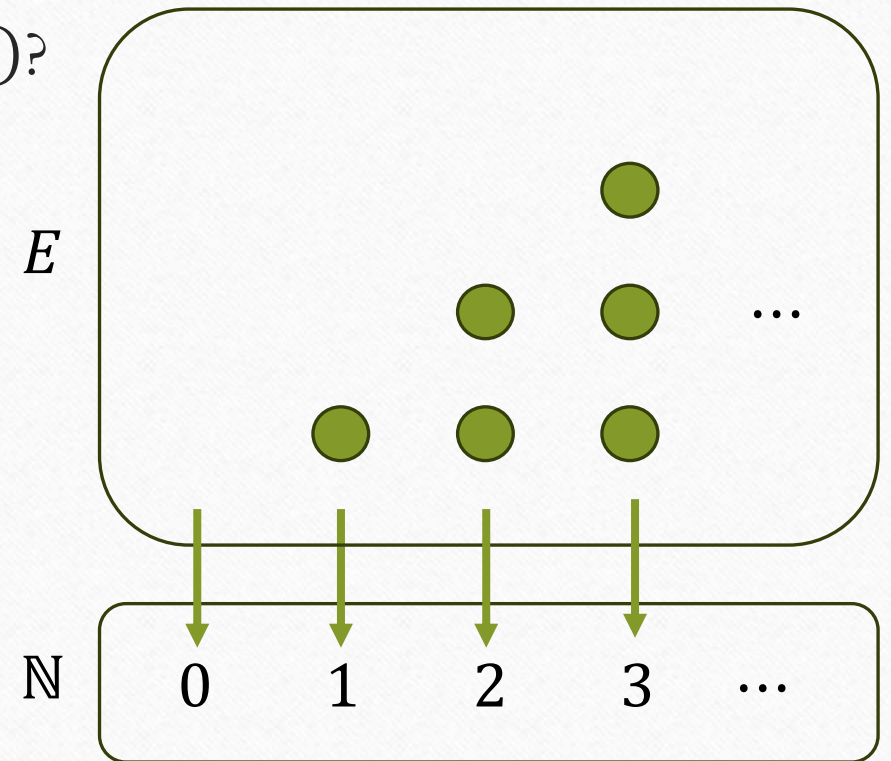

We claim $L(X) = \sum_{n \in \mathbb{N}} X^n$. That means $L : X \mapsto L(X)$ is isomorphic to the polynomial functor associated to the arrow $(n \mid n \in \mathbb{N})$ in \mathcal{C}/\mathbb{N} .

- What is \mathbb{N} ?
- What arrow $E \rightarrow \mathbb{N}$ corresponds to $(n \mid n \in \mathbb{N})$?

$L(X)$: list object on an object X
The polynomial functor associated to $(B_a \mid a \in A)$ is $X \mapsto \sum_a X^{B_a}$

The list polynomial?

What arrow $E \rightarrow \mathbb{N}$ corresponds to $(n \mid n \in \mathbb{N})$?

\mathbb{N} : an object which acts like the natural numbers

The list polynomial?

What arrow $E \rightarrow \mathbb{N}$ corresponds to $(n \mid n \in \mathbb{N})$?

$$E = \{(m, n) : m < n\}$$

$$\pi_2^E : E \rightarrow \mathbb{N}$$

\mathbb{N} : an object which acts like the natural numbers

The list polynomial (supposedly)

We claim that $\pi_2^E : E \rightarrow \mathbb{N}$ is exponentiable, and that the functor $L : X \mapsto L(X)$ is isomorphic to:

$$\begin{array}{ccccccc}
 \mathcal{C} & \xrightarrow{\Delta_{\mathbb{N}}} & \mathcal{C}/\mathbb{N} & \xrightarrow{(-)^{\pi_2^E}} & \mathcal{C}/\mathbb{N} & \xrightarrow{\Sigma_{\mathbb{N}}} & \mathcal{C} \\
 X & \longmapsto & (X \mid n \in \mathbb{N}) & \longmapsto & (X^n \mid n \in \mathbb{N}) & \longmapsto & \sum_{n \in \mathbb{N}} X^n
 \end{array}$$

How do we prove this?

$L(X)$: list object on an object X

\mathbb{N} : an object which acts like the natural numbers

$\pi_2^E : E \rightarrow \mathbb{N}$ is an arrow which intuitively satisfies $(\pi_2^E)^{-1}(n) = \{1, 2, \dots, n\}$

The right adjoints

Consider the decomposition $L = \Sigma_{\mathbb{N}} \circ L_{\mathbb{N}}$:

$$\begin{aligned} \text{length}(\emptyset) &= 0, \\ \text{length}(x :: \ell) &= \text{length}(\ell) + 1 \end{aligned}$$

$$\mathcal{C} \xrightarrow{L_{\mathbb{N}} : X \mapsto (\text{length} : L(X) \rightarrow \mathbb{N})} \mathcal{C}/\mathbb{N} \xrightarrow{\Sigma_{\mathbb{N}}} \mathcal{C}$$

$$\begin{array}{ccccc} \mathcal{C} & \xrightarrow{\Delta_{\mathbb{N}}} & \mathcal{C}/\mathbb{N} & \xrightarrow{(-)^{\pi_2^E}} & \mathcal{C}/\mathbb{N} & \xrightarrow{\Sigma_{\mathbb{N}}} & \mathcal{C} \\ & \xleftarrow{\Sigma_{\mathbb{N}}} & & \xleftarrow{\pi_2^E \times (-)} & & & \end{array}$$

$L(X)$: list object on an object X

\mathbb{N} : an object which acts like the natural numbers

$$\Sigma_{\mathbb{N}} : (A \rightarrow \mathbb{N}) \mapsto A, \quad \Delta_{\mathbb{N}} : X \mapsto (\pi_2 : X \times \mathbb{N} \rightarrow \mathbb{N})$$

In short:

To prove the list object functor is polynomial, we just need to show that

$$L_{\mathbb{N}} : \mathcal{C} \rightarrow \mathcal{C}/\mathbb{N}$$

$$X \mapsto (\text{length} : L(X) \rightarrow \mathbb{N})$$

is a right adjoint to

$$\begin{array}{ccccc} \mathcal{C} & \xleftarrow{\Sigma_{\mathbb{N}}} & \mathcal{C}/\mathbb{N} & \xleftarrow{\pi_2^E \times (-)} & \mathcal{C}/\mathbb{N} \\ E \times_{\mathbb{N}} A & \xleftarrow{\quad\quad\quad} & & \xleftarrow{\quad\quad\quad} & (A \rightarrow \mathbb{N}) \end{array}$$

Basic strategy

We construct a natural transformation $(\varepsilon_X : E \times_{\mathbb{N}} L(X) \rightarrow X)_X$ (which will be the co-unit) and show it satisfies the appropriate universal property:

For every $l_A : A \rightarrow \mathbb{N}$ and every $g : E \times_{\mathbb{N}} A \rightarrow X$,
there exists a unique $h : A \rightarrow L(X)$ such that
 $length \circ h = l_A$ and $\varepsilon_X \circ (Id \times_{\mathbb{N}} h) = g$.

Requirements

We need to make the following assumptions about the category \mathcal{C} :

- \mathcal{C} has all finite limits and list objects

Requirements

We need to make the following assumptions about the category \mathcal{C} :

- \mathcal{C} has all finite limits and list objects
- \mathcal{C} is **extensive**, though we can weaken this assumption to the following:

$$\begin{array}{ccccc}
 A_0 & \longrightarrow & A & \longleftarrow & A_{>0} \\
 \downarrow & & \downarrow l_A & & \downarrow \\
 \mathbb{1} & \xrightarrow{0} & N & \xleftarrow{s} & N
 \end{array}$$

$$\begin{array}{ccccc}
 \mathbb{1} & \xrightarrow{r_0^X} & L(X) & \xleftarrow{r_1^X} & X \times L(X) \\
 \downarrow & & \downarrow \text{len}_X & & \downarrow \text{len}_X \circ \pi_2 \\
 \mathbb{1} & \xrightarrow{0} & N & \xleftarrow{s} & N
 \end{array}$$

In an **extensive** category with finite limits and list objects, the list object functor is polynomial

In an **extensive** category with finite limits and list objects, the list object functor is polynomial

Thanks for listening!
