# SWI-Prolog

- ▶ Install - <https://www.swi-prolog.org>
- ▶ Start - swipl
- ▶ Load - consult('file.pl').
- ▶ Quit - halt.
- ▶ Debug - trace. / notrace.

# Programming in Prolog

Prolog tries to answer the query, that is showing the question can be logically derived from the facts and rules.

- ▶ Resolution
- ▶ Unification
- ▶ Searching and Backtracking

```
/* deduce that Socrates is mortal */  
mortal(M) :- man(M). % rule  
man(socrates). % fact  
  
mortal(X). % query  
man(Y). % query
```

# Atom

- ▶ strings of letters, digits, and the underscore, starting with a lowercase letter. E.g., `haskell2prolog`, `haskell_Prolog`.
- ▶ strings of special characters. E.g., `;` and `,` and `:-`.
- ▶ strings of characters enclosed in single quote. E.g., `'Prolog'`, `'&%#$'`.

# Number

- ▶ Integers. E.g., 1, 2, 3
- ▶ Real Numbers. E.g., 3.14, 1.414

# Variable

- ▶ strings of letters, digits, and underscore character and start with an uppercase letter or an underscore. E.g., X, \_unknown, X\_751.
- ▶ Anonymous Variable: underscore. E.g., \_

- ▶ fact, rule, query ends with .
- ▶ , - and
- ▶ ; - or
- ▶ not - negate

# Prolog list operations

- ▶ head
- ▶ tail
- ▶ my\_concat
- ▶ remove\_one
- ▶ remove\_all
- ▶ nth\_element
- ▶ my\_append
- ▶ my\_length
- ▶ my\_reverse
- ▶ my\_member
- ▶ prefix\_list
- ▶ suffix\_list

## cut operator - !

We can use ! cut to control backtracking in Prolog.

- ▶ it always succeeds.
- ▶ it cuts unwanted backtracking.
- ▶ it improves efficiency.

## cut example 1

What is the output?

```
fact(a).  
fact(b).  
fact(c).
```

```
answer1(X) :- fact(X).  
answer1(otherwise).
```

```
answer2(X) :- fact(X),!.  
answer2(otherwise).
```

## cut example 2

What is the output?

```
fact_x(1).
```

```
fact_x(2).
```

```
fact_y(3).
```

```
fact_y(4).
```

```
fact_z(5).
```

```
fact_z(6).
```

```
solve1(X,Y,Z) :- fact_x(X), fact_y(Y), fact_z(Z).
```

```
solve2(X,Y,Z) :- fact_x(X), !, fact_y(Y), fact_z(Z).
```

## cut example 3

What is the output?

```
fun(a).  
fun(b) :- !.  
fun(c).  
  
q1(X) :- fun(X).  
  
q2(X,Y) :- fun(X), fun(Y).  
  
q3(X,Y) :- fun(X), !, fun(Y).
```
