Category of Graphs

Gph is the category with:

- **Objects** are graphs G with:
 - A set of vertices V(G)
 - A set of edges E(G) which are unordered pairs of vertices {v, w}; notate v ~ w
 - We have at most one edge between any two vertices; loops are allowed.

Z/2 Equivariant П Doooooooo Wrap-Up 00

Graph Homomorphisms

Gph is the category with:

- Homomorphisms f : G → H map vertices to vertices and respect adjacency:
 - $f: V(G) \rightarrow V(H)$ a function of sets
 - If $v \sim w \in E(G)$, then $f(v) \sim f(w) \in E(H)$
 - If $v \sim w$ we can map v, w to the same vertex if we have a loop

• ×-homotopy: change one vertex to another connected vertex abcfhj = accfhj = acfjk

Reflexive Fundamental Groupoid

For a reflexive graph G, we define the **reflexive fundamental** groupoid $\Pi_r(G)$, as follows:

- Objects of $\Pi_r(G)$ are vertices v of the graph G.
- An arrow $v_0 \rightarrow v_n$ in $\prod_r(G)$ is given by a walk $v_0v_1v_2v_3...v_n$ where $v_i \sim v_{i+1}$.
- two walks represent the same arrow if they are equvialent under:
 - prunes which remove repetition : [vv] = [v]
 - homotopy rel endpoints as map I_n → G, I_n looped ie shifting one vertex to an adjacent vertex
- Composition of morphisms is defined using concatenation of walks.

abbcehihj = *abbceh* = *abbcegj*

Fundamental Groupoid of G

For a graph G, we define the **fundamental groupoid** $\Pi(G)$ as follows:

- Objects of $\Pi(G)$ are vertices v of the graph G.
- An arrow $v_0 \rightarrow v_n$ in $\Pi(G)$ is given by a walk $v_0v_1v_2v_3...v_n$ where $v_i \sim v_{i+1}$.

Fundamental Groupoid of G

For a graph G, we define the **fundamental groupoid** $\Pi(G)$ as follows:

- Objects of $\Pi(G)$ are vertices v of the graph G.
- An arrow $v_0 \rightarrow v_n$ in $\Pi(G)$ is given by a walk $v_0v_1v_2v_3...v_n$ where $v_i \sim v_{i+1}$.

• two walks represent the same arrow if they are equvialent under:

- prunes which remove a backtrack : [vwv] = [v]
- homotopy rel endpoints as map P_n → G, P_n unlooped ie shifting one vertex to a (not necessarily adjacent) vertex
- Composition of morphisms is defined using concatenation of walks.

Fundamental Groupoid of G

For a graph G, we define the **fundamental groupoid** $\Pi(G)$ as follows:

- Objects of $\Pi(G)$ are vertices v of the graph G.
- An arrow $v_0 \rightarrow v_n$ in $\Pi(G)$ is given by a walk $v_0v_1v_2v_3...v_n$ where $v_i \sim v_{i+1}$.

• two walks represent the same arrow if they are equvialent under:

- prunes which remove a backtrack : [vwv] = [v]
- homotopy rel endpoints as map P_n → G, P_n unlooped ie shifting one vertex to a (not necessarily adjacent) vertex
- Composition of morphisms is defined using concatenation of walks.
- Walks are even or odd

Walks of Edges

Idea:

- graphs are built out of edges, connected with vertices
- create walks that are sequences of edges
- two consecutive edges are imes-homotopic as maps $K_2
 ightarrow G$

Reflexive Π 0000000 Non-Reflexive Π 0000000 Edge View

ℤ/2 Equivariant Γ 00000000 Wrap-Up 00

Walks of Edges

Idea:

- graphs are built out of edges, connected with vertices
- create walks that are sequences of edges
- two consecutive edges are imes-homotopic as maps $K_2
 ightarrow G$

In particular, two edges are adjacent when they share a vertex:

$$\begin{array}{c} a & a \\ | \times | \\ b & d \end{array} \qquad \begin{array}{c} a & c \\ | \times | \\ b & b \end{array}$$

Edges are ordered and cartwheel through the graph

Edge Graph

Define the edge graph of G, denoted, G^E , as looped subgraph of exponential G^{K_2} :

- vertices of G^E are graph homomorphisms $K_2 \rightarrow G$ ie a (directed) edge
- edges of G^E between homomorphisms that are \times -homotopic
- G^E is a reflexive graph

Suppose we have G:

Then G^E is the reflexive graph (loops suppressed):

Example of G^E

Suppose we have G:

Then G^E is the reflexive graph (loops suppressed):

Reflexive Π 0000000 Non-Reflexive Π 0000000 Edge View

ℤ/2 Equivariant ∣ 00000000 Wrap-Up 00

First Connection

Since G^E is reflexive, we can form the reflexive fundamental groupoid $\Pi_r(G^E)$ Thm $\Pi_r(G^E)$ is equivalent to the even subgroupoid of $\Pi(G)$ G:

 G^E :

Z/2 Equivariant Π ●0000000 Wrap-Up 00

$\mathbb{Z}/2$ action on Edges

We have said:

- we have $\mathbb{Z}/2$ action on ${\it G}^{\it E}$ that flips edge, reversing direction
- we can form an equivariant fundamental groupoid

Edge View

 $\mathbb{Z}/2$ Equivariant Π 0000000 Wrap-Up 00

Equivariant Fundamental Groupoid

G a reflexive graph with a $\mathbb{Z}/2$ action. $\Pi_{\mathbb{Z}/2}G$ defined by:

- objects are vertices of G
- arrows $x_0 \rightarrow x_n$ of two forms:
 - a walk α from x_0 to x_n in $\prod_r(G)$. Denote by $(\alpha, 1)$.
 - a walk β from x_0 to τx_n in $\prod_r(G)$, plus a 'jump' by the non-zero element $\tau \in \mathbb{Z}/2$. Denote by (β, τ) .

Composition via concatenation:

• $(\alpha, 1) * (\beta, 1) = (\alpha * \beta), 1)$

•
$$(\alpha, 1) * (\beta, \tau) = (\alpha * \beta), \tau)$$

•
$$(\alpha, \tau) * (\beta, 1) = (\alpha * \tau(\beta), \tau)$$

• $(\alpha, \tau) * (\beta, \tau) = (\alpha * \tau(\beta), 1)$

- graph is reflexive, loops suppressed
- equip with antipodal $\mathbb{Z}/2$ -action

A loop in $\Pi_{\mathbb{Z}/2}G$: $(ab - cd - ca - ba, \tau)$
