## Class Inventory: An Earlier Example

```
public class Inventory
{
    public final int MIN = 0;
    public final int MAX = 100;
    public final int CRITICAL = 10;
    public boolean add(int amount)
    {
        int temp;
        temp = stockLevel + amount;
        if (temp > MAX)
        {
            System.out.print("Adding " + amount + " item will
                             cause stock ");
            System.out.println("to become greater than " + MAX +
                               " units (overstock)");
            return(false);
        }
    }
}
```

James Tam

## Class Inventory: An Earlier Example (2)

```
else
{
    stockLevel = stockLevel + amount;
    return(true);
}
} // End of method add()
...
```

## Some Hypothetical Method Calls: Condition/Return

```
reference1.method1()
    if (reference2.method2() == false)
        return(false);
```

```
reference2.method2()
    if (store.addToInventory(amt) == false)
        return(false);
```

```
store.addToInventory(int amt)
    if (temp > MAX)
        return(false);
```

James Tam

## Some Hypothetical Method Calls: Condition/Return

```
reference1.method1()
    if (reference2.method2() == false)
        return(false);
```

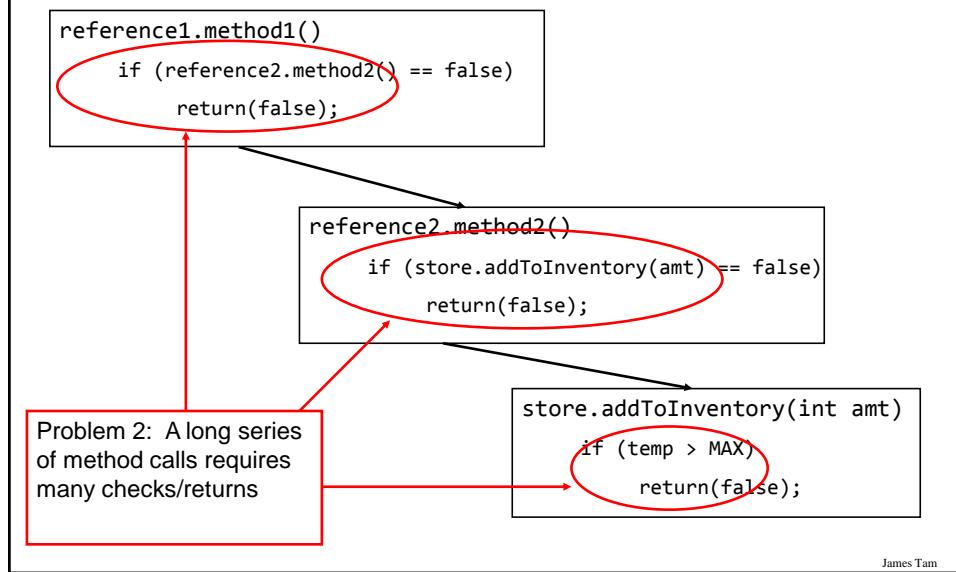

Problem 1: The calling  
method may forget to  
check the return value

```
reference2.method2()
    if (store.addToInventory(amt) == false)
        return(false);
```

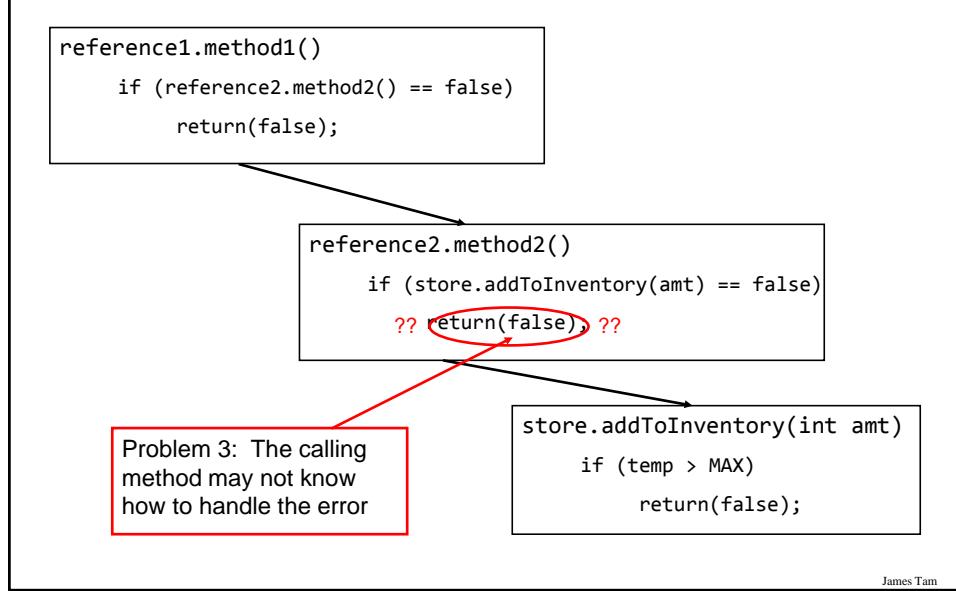

```
store.addToInventory(int amt)
    if (temp > MAX)
        return(false);
```

## Handling Exceptions

### **Format:**

```
try
{
    // Code that may cause an error/exception to occur
}
catch (ExceptionType identifier)
{
    // Code to handle the exception
}
```

## Handling Exceptions: Reading Input

Location of the online example:

/home/233/examples/exceptions/handlingExceptions/inputExample

```
public class Driver {  
    public static void main (String [] args)  
    {  
        BufferedReader stringInput;  
        InputStreamReader characterInput;  
        String s;  
        int num;  
        characterInput = new InputStreamReader(System.in);  
        stringInput = new BufferedReader(characterInput);
```

James Tam

## Handling Exceptions: Reading Input (2)

```
try  
{  
    System.out.print("Type an integer: ");  
    s = stringInput.readLine();  
    System.out.println("You typed in..." + s);  
    num = Integer.parseInt (s);  
    System.out.println("Converted to an integer..."  
                      + num);  
}  
catch (IOException e)  
{  
    System.out.println(e);  
}  
catch (NumberFormatException e)  
{  
    ...  
}
```

James Tam

## Handling Exceptions: Where The Exceptions Occur

```
try
{
    System.out.print("Type an integer: ");
    s = stringInput.readLine();
    System.out.println("You typed in..." + s);
    num = Integer.parseInt (s);
    System.out.println("Converted to an integer..." +
                       +num);
}
```

The first exception can occur here

James Tam

## Handling Exceptions: Result Of Calling BufferedReader.ReadLine()

```
try
{
    System.out.print("Type an integer: ");
    s = stringInput.readLine();
    System.out.println("You typed in..." + s);
    num = Integer.parseInt (s);
    System.out.println("Converted to an integer..." +
                       +num);
}
```

James Tam

## Where The Exceptions Occur In Class BufferedReader

- For online documentation for this class go to:

- <http://docs.oracle.com/javase/7/docs/api/java/io/BufferedReader.htm>

```
public class BufferedReader
{
    public BufferedReader(Reader in);
    public BufferedReader(Reader in, int sz);
    public String readLine() throws IOException;
    ...
}
```

James Tam

## Handling Exceptions: Result Of Calling Integer.parseInt ()

```
try
{
    System.out.print("Type an integer: ");
    s = stringInput.readLine();
    System.out.println("You typed in..." + s);
    num = Integer.parseInt (s);
    System.out.println("Converted to an integer..." +
                       +num);
}
```

The second exception  
can occur here

## Avoid Squelching Your Exceptions

```
try
{
    s = stringInput.readLine();
    num = Integer.parseInt (s);
}
catch (IOException e)
{
    System.out.println(e);
}
catch (NumberFormatException e)

## Avoid Squelching Your Exceptions

**NO!**

```
try

## The Finally Clause

- An additional part of Java's exception handling model (`try-catch-finally`).
- Used to enclose statements that must always be executed whether or not an exception occurs.

James Tam

## The Finally Clause: Exception Thrown

```
try
{
    f.method();
}
```

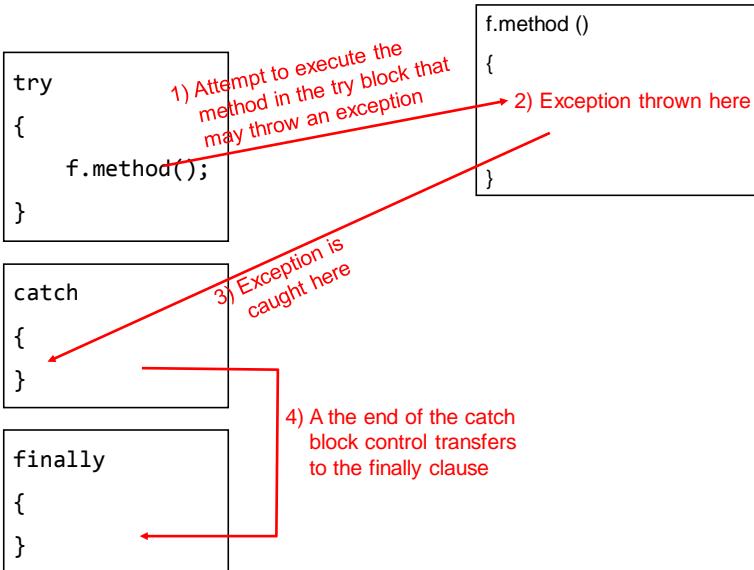

```
catch
{
}
```

```
finally
{
}
```

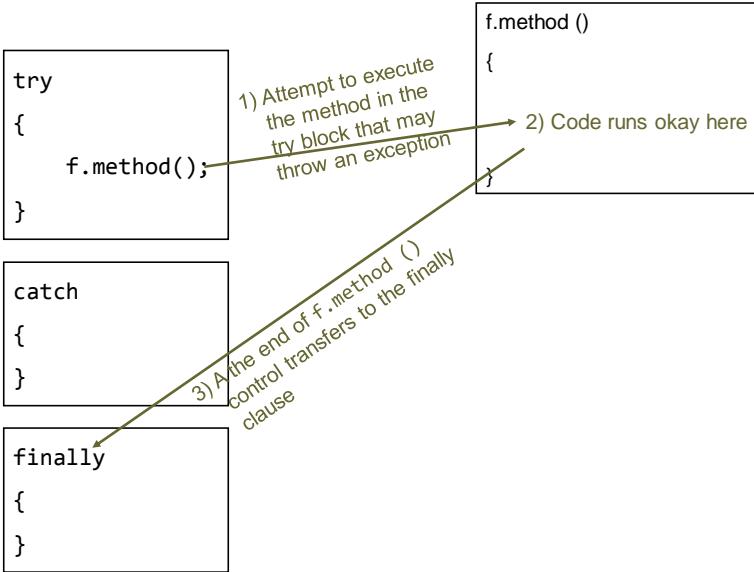

```
f.method ()
{
}
```

- If you are catching a sequence of exceptions then make sure that you catch the exceptions for the child classes before you catch the exceptions for the parent classes
- Deal with the more specific case before handling the more general case

## Branches: Specific Before General

### • Correct

```
If (x > 100)
    body;
else if (x > 10)
    body;
else if (x > 0)
    body;
```

### • Incorrect

```
If (x > 0)
    body;
else if (x > 10)
    body;
else if (x > 100)
    body;
```

## Inheritance And Catching Exceptions (2)

Correct

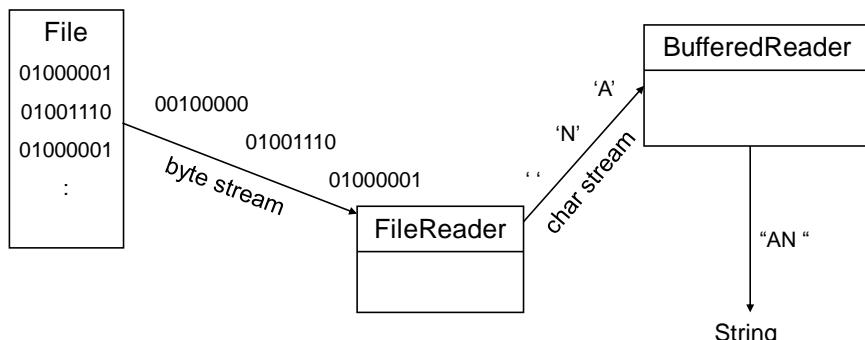

```
try
{
}
catch (EOFException e)
{
}
catch (IOException e)
{
}
```

Incorrect

```
try
