

# Recursion

You will learn the definition of recursion as well as seeing how simple recursive programs work

## What Is Recursion?

*“the determination of a succession of elements by operation on one or more preceding elements according to a rule or formula involving a finite number of steps”*  
(Merriam-Webster online)

## What This Really Means

*Breaking a problem down into a series of steps. The final step is reached when some basic condition is satisfied.*

***The solution for each step is used to solve the previous step.*** *The solution for all the steps together form the solution to the whole problem.*

(The “Tam” translation)

## Definition Of Philosophy

*“...state of mind of the wise man; practical wisdom...”*<sup>1</sup>

***See Metaphysics***

<sup>1</sup> The New Webster Encyclopedic Dictionary of the English Language

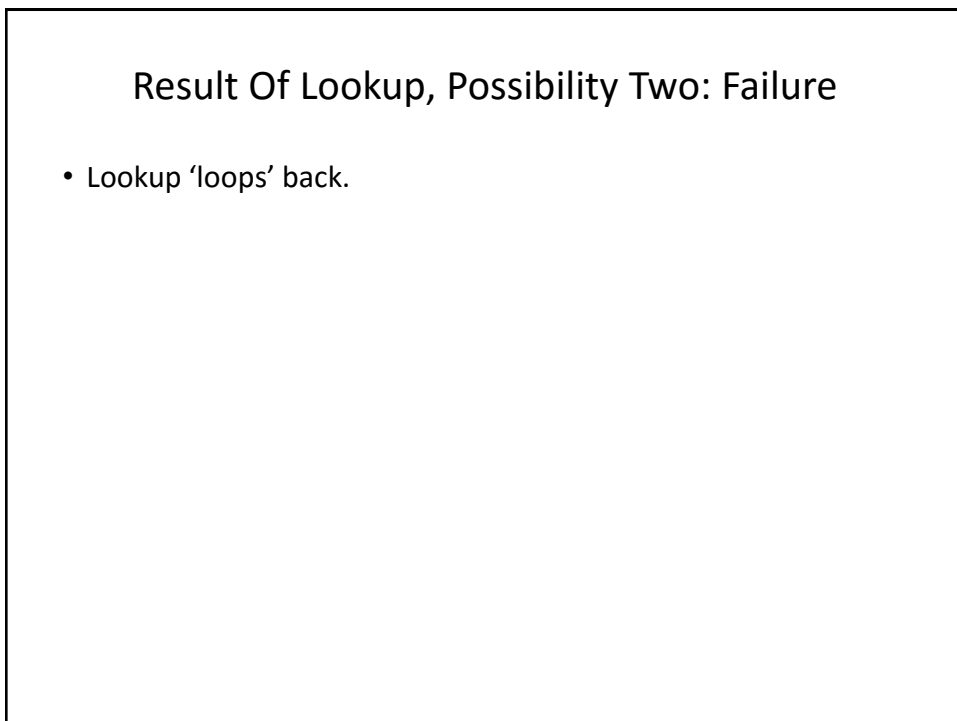

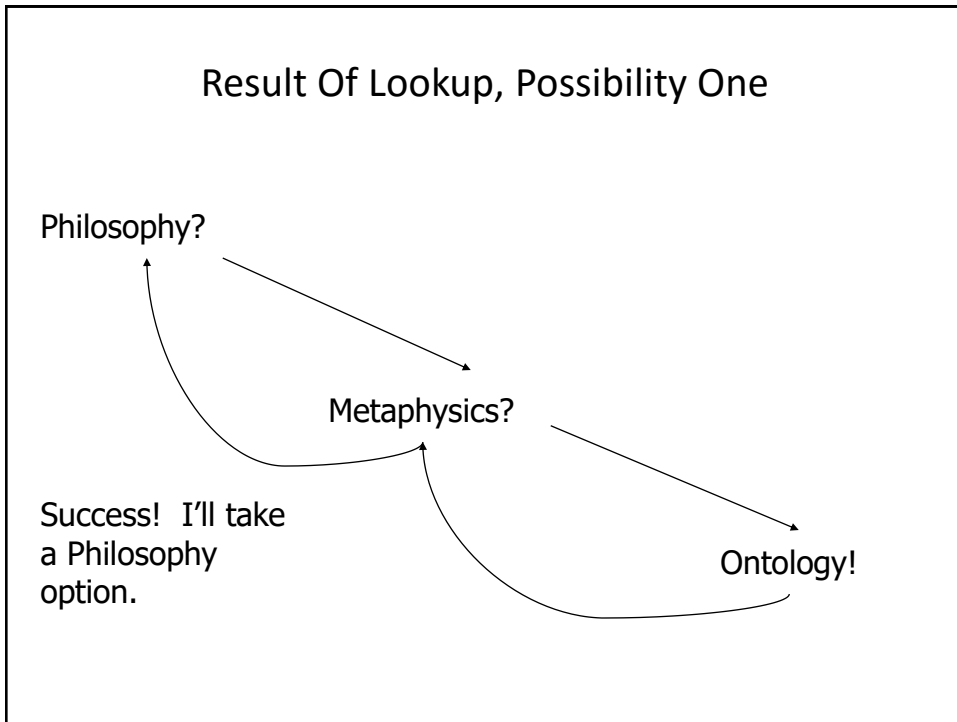

## Metaphysics

*"...know the ultimate grounds of being or what it is that really exists, embracing both psychology and **ontology**."* <sup>2</sup>

<sup>2</sup> The New Webster Encyclopedic Dictionary of the English Language

## Result Of Lookup , Possibility One: Success

- I know what Ontology means!

## Result Of Lookup, Possibility Two

Philosophy?

Metaphysics?

**Rats!!!**

See  
previous

Ontology?

```
graph TD; A[Philosophy?] --> B[Metaphysics?]; B --> C[Ontology?]; C -- "See previous" --> B;
```

## Ontology

*"...equivalent to metaphysics."*<sup>3</sup>

<sup>3</sup> The New Webster Encyclopedic Dictionary of the English Language

Wav file from "The Simpsons"

## Result Of Lookup, Possibility Three: Failure

- You've looked up everything and still don't know the definition!

## Looking Up A Word

```
if (you completely understand a definition) then
    return to previous definition (using the definition that's
    understood)
else
    lookup (unknown word(s))
```

## Recursion In Programming

*"A programming technique whereby a function calls itself either directly or indirectly."*

### Direct Call

```
def fun ():  
    ...  
    fun ()  
    ...
```

## Indirect Call

## Indirect Call

## Indirect Call (2)

Name of the example program: recursive.py

```
def fun1():  
    fun2()
```

```
def fun2():  
    fun1()
```

```
fun1()
```

## Requirements For *Sensible* Recursion

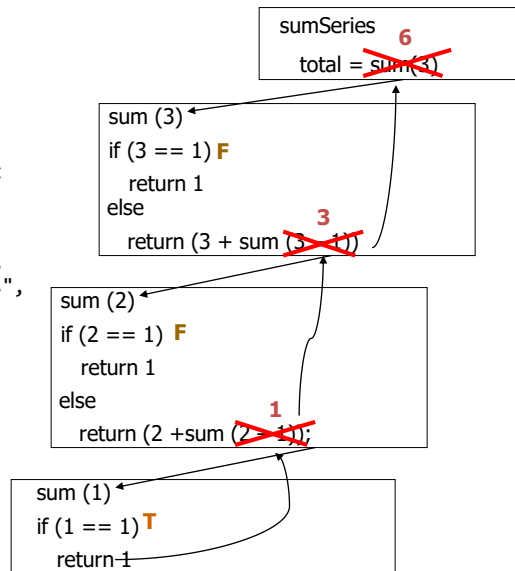

- 1) Base case
- 2) Progress is made (towards the base case)

## Example Program: sumSeries.py

```
def sum(no):
    if (no == 1):
        return 1
    else:
        return (no + sum(no-1) )

def start():
    last = input ("Enter the last
                  number: ")
    last = (int)last
    total = sum(last)
    print ("The sum of the series
           from 1 to", last, "is",
           total)

start()
```

## When To Use Recursion

- When a problem can be divided into steps.
- The result of one step can be used in a previous step.
- There is a scenario when you can stop sub-dividing the problem into steps (step = recursive call) and return to a previous step.
  - Algorithm goes back to previous step with a partial solution to the problem (back tracking)
- All of the results together solve the problem.

## When To Consider Alternatives To Recursion

- When a loop will solve the problem just as well
- Types of recursion (for both types a return statement is excepted)
  - **Tail recursion**
    - The last statement in the function is another recursive call to that function  
This form of recursion can easily be replaced with a loop.
  - **Non-tail recursion**
    - The last statement in the recursive function is not a recursive call.
    - This form of recursion is very difficult (read: impossible) to replace with a loop.

## Example: Tail Recursion

- Tail recursion: A recursive call is the last statement in the recursive function.
- Name of the example program: `tail.py`

```
def tail(no):  
    if (no <= 3):  
        print (no)  
        tail(no+1)  
    return()  
  
tail(1)
```

## Example: Non-Tail Recursion

- Non-Tail recursion: A statement which is not a recursive call to the function comprises the last statement in the recursive function.
- Name of the example program: `nonTail.py`

```
def nonTail(no):  
    s  
    if (no < 3):  
        nonTail(no+1)  
    print(no)  
    return()  
  
nonTail(1)
```

## Error Handling Example Using Recursion

- Name of the example program: `errorHandling.py`
    - Iterative/looping solution (month must be between 1 – 12)
- ```
month = -1  
while ((month < 1) or (month > 12)):  
    month = int(input("Enter birth month (1-12): "))
```

James Tam

## Error Handling Example Using Recursion (2)

– Iterative/looping solution (day must be between 1 – 31)

```
def promptDay():  
    day = int(input("Enter day of birth (1-31): "))  
    if ((day < 1) or (day > 31)):  
        day = promptDay()  
    return(day)  
  
...  
day = promptDay()
```

James Tam

## Drawbacks Of Recursion

Function calls can be costly

- Uses up memory
- Uses up time

## Benefits Of Using Recursion

- Simpler solution that's more elegant (for some problems)
- Easier to visualize solutions (for some people and certain classes of problems – typically require either: non-tail recursion to be implemented or some form of “backtracking”)

## Common Pitfalls When Using Recursion

- These three pitfalls can result in a runtime error
  - No base case
  - No progress towards the base case
  - Using up too many resources (e.g., variable declarations) for each function call

## No Base Case

```
def sum(no):  
    return(no + sum (no - 1))
```

## No Base Case

```
def sum (no):  
    return (no + sum (no - 1))
```

When does it stop???

## No Progress Towards The Base Case

```
def sum (no):  
    if (no == 1):  
        return 1  
    else:  
        return (no + sum (no))
```

## No Progress Towards The Base Case

```
def sum (no):  
    if (no == 1):  
        return 1  
    else:  
        return (no + sum (no))
```

The recursive case doesn't make any progress towards the base (stopping) case

## Using Up Too Many Resources

- Name of the example program: `recursiveBloat.py`

```
def fun(no):
    print(no)
    alist = []
    for i in range (0, 10000000, 1):
        alist.append("*")
    no = no + 1
    fun(no)

fun(1)
```

## Undergraduate Student Definition Of Recursion

Word: **re-cur-sion**

Pronunciation: ri-'k&r-zh&n

Definition: See recursion
